Slaty-backed Forest Falcon
*Micrastur mirandollei*

in north-west Ecuador

Slaty-backed Forest Falcon *Micrastur mirandollei* is rarely encountered but widespread in humid lowland forest from Costa Rica south to Brazil. For Ecuador, Ridgely & Greenfield noted confirmed records in the Amazonian lowlands and an unconfirmed record from the north-west. Documented reports from western Ecuador known to us are as follows: (1) a tape-recording considered probably of this species made near San Lorenzo, prov. Esmeraldas, on 23 February 1997, by J. Nilsson; (2) a bird tape-recorded at Río Canandé, prov. Esmeraldas, on 12 September 2006, by P. Coopmans & J. Olah (pers. comm.); and (3) a report at Playa de Oro, prov. Esmeraldas, that requires confirmation, by O. Jahn.

On 30 July 2010 we observed a Slaty-backed Forest Falcon at the start of the waterfall trail within the territory of the Playa de Oro community, prov. Esmeraldas, at c.150 m (00°51′N 78°44′W). The bird was calling from within primary forest characterised by an abundance of large trees reaching heights of c.30–40 m and sparse undergrowth. We sound-recorded it (www.xeno-canto.org; XC92172) and on playback the bird instantly flew towards us but we acquired only brief views. Shortly thereafter, we relocated it perched in a small tree c.4 m above ground. We approached it to c.8 m and obtained photographs (Figs. 1–2). The bird called persistently throughout the observation.

We identified it as a juvenile Slaty-backed Forest Falcon from the literature. It was a mid-sized *Micrastur* with uniform dark grey upperparts including face and neck, pale whitish underparts, with a scaly breast pattern of clear dark chevrons formed by dark brown feather fringes; uppertail dark with three narrow whitish bands and a narrow white tip; eye-ring, bill base and legs were yellow. Potential confusion species such as Bicoloured Hawk *Accipiter bicolor*, Semiplumbeous Hawk *Leucopternis semiplumbeus* and three other *Micrastur* ssp. known from Playa de Oro do not show a combination of scaled breast pattern with uniform grey upperparts. The vocalisation was rather plaintive, a rising series of c.10–13 nasal *aah* notes delivered continuously, somewhat reminiscent of Laughing Falcon *Herpetotheres cachinnans*.

Our recording supports the identification as Slaty-backed Forest Falcon. The bird’s persistent calling from the lower forest strata suggests that its nest may have been nearby as is known for other juvenile *Micrastur* (U. Valdez pers. comm.).

Our record is the first photographed, and perhaps the first visual observation of Slaty-backed Forest Falcon in western Ecuador. The species is known from the Pacific lowlands of Colombia south to south-west Nariño, and its occurrence in north-west Ecuador was therefore to be expected.
